

## SEAL ENDS ONCE INHIBITS WOOD ROT

After many years of experience manufacturing nano technology Seal-Once waterproofer we realized that sealing the end cuts of wood will prevent rot and decay. Raw end grain can absorb water like a sponge which is very difficult and impossible to stop.

Treating cut ends with just two coats of Seal-Once retail or multi surface concentrate does not contain the right amount of solids to prevent water absorption. Protection is minimal. We have introduced a new formula that contains high solids to prevent maximum water absorption. The product name is SEAL ENDS ONCE. By applying two coats with a squeegee applicator bottle containing 68% solids (34% solids per coat) the ends are totally sealed for up to 10 years. Use on all types of wood from southern yellow pine (PT) to iron woods such as IPE.

In new construction and repairs all cut ends should be sealed with SEAL ENDS ONCE. Quart and gallon cans are available and the product can be applied with a brush or paint pad. These simple steps do not take much time and can save dollars in damage.

SEAL ENDS ONCE does an excellent job of sealing the end grain of dimensional lumber. The product will penetrate freshly sawn logs to prevent checking and cracking.

SEAL ENDS ONCE is based on the same successful formula as SEAL-ONCE which is non-toxic, has zero voc's, is eco-friendly and GREEN. No other product on the market can compare in long term performance.
